# Spectrum Advisors Preferred Fund

An adaptive equity fund focused on generating alpha through broad equity exposure in addition to diversifying its holdings with fixed income to boost or buffer equity returns, providing the investor with streamlined diversification.

**30+ Years of Market Research**

The Fund benefits from the investment philosophy that the Spectrum team has molded and shaped over the last 30+ years. Identifying, quantifying, and understanding the current market environment through price analysis allows the portfolio to favorably react to current trends happening in the market.

**A Simply Way to Access Diversification**

The focus of the Spectrum Advisors Preferred Fund is to provide opportunistic access to two major broad market categories: equities and bonds. With a short to intermediate term outlook driven by price analysis, the Fund attempts to be exposed to more positive market periods than negative ones.

**Managing Significant Market Risk**

The Fund seeks to avoid excessive market drawdowns experienced in the equity markets, similar to the March 2020 market sell-off. The Spectrum Advisors Preferred Fund presents itself as a smart choice for equity exposure in an investor's portfolio, compared to an indexed alternative.

**Growth of a \$10,000 Investment**

The Fund has returned an average of 11.70% annually since inception through 09/30/2021\*

**Portfolio Allocation**

**Expense Ratio**  
2.35%

Portfolio statistics are based on 5 year calculations from Morningstar, FastTrack Data, and Bloomberg.

**Standard Deviation:** is also known as historical volatility and is used by investors as a gauge for the amount of expected volatility. It is a measure of the dispersion of a set of data from its mean. **Sharpe Ratio:** a risk-adjusted measure calculated by dividing a fund's annualized excess returns over the risk-free rate by its annualized standard deviation. The higher the Sharpe ratio, the better the fund's historical risk-adjusted performance. **Beta:** a statistic that measures volatility of the fund, as compared to that of the overall market. The market's beta is set at 1; a higher beta than 1 is considered to be more volatile than the market, while a beta lower than 1 is considered to be less volatile. **R-Squared:** a measurement of how closely a fund's performance correlates with an index. It can range between 0 and 1. An r-squared of 1 indicates perfect correlation, while 0 indicates no correlation. **Up Market Capture:** a statistical measure of an investment manager's overall performance in up markets. The up market capture ratio is used to evaluate how well an investment manager performed relative to an index during periods when that index rose. **Down Market Capture:** a statistical measure of an investment manager's overall performance in down markets. The down market capture ratio is used to evaluate how well or poorly an investment manager performed relative to an index during periods when that index has dropped.

© 2021 Morningstar, Inc. All Rights Reserved. The information contained herein: (1) is proprietary to Morningstar; (2) may not be copied or distributed; and (3) is not warranted to be accurate, complete or timely. Neither Morningstar nor its content providers are responsible for any damages or losses arising from any use of this information. Past performance is no guarantee of future results. The Morningstar Rating™ for funds, or "star rating", is calculated for managed products (including mutual funds, variable annuity and variable life subaccounts, exchange-traded funds, closed-end funds, and separate accounts) with at least a three-year history. Exchange-traded funds and open-ended mutual funds are considered a single population for comparative purposes. It is calculated based on a Morningstar Risk-Adjusted Return measure that accounts for variation in a managed product's monthly excess performance, placing more emphasis on downward variations and rewarding consistent performance. The top 10% of products in each product category receive 5 stars, the next 22.5% receive 4 stars, the next 35% receive 3 stars, the next 22.5% receive 2 stars, and the bottom 10% receive 1 star. The Overall Morningstar Rating for a managed product is derived from a weighted average of the performance figures associated with its three-, five-, and 10-year (if applicable) Morningstar Rating metrics. The weights are: 100% three-year rating for 36-59 months of total returns, 60% five-year rating/40% three-year rating for 60-119 months of total returns, and 50% 10-year rating/30% five-year rating/20% three-year rating for 120 or more months of total returns. While the 10-year overall star rating formula seems to give the most weight to the 10-year period, the most recent three-year period actually has the greatest impact because it is included in all three rating periods. Morningstar Rating is for the Service share class only; other classes may have different performance characteristics.

**Consider these risks before investing:** Bond risk, derivatives risk, equity risk, inverse ETF risk, junk bond risk, leverage risk, management risk, market risk, mutual fund and ETF risk, short position risk, small and medium capitalization risk, and turnover risk. There is no guarantee the fund will achieve its investment objective. You can lose money by investing in the fund. Please carefully review the prospectus for detailed information about these risks.

S&P TR 500 Index is a capitalization weighted index of 500 stocks representing all major domestic industry groups. The S&P 500 TR assumes the reinvestment of dividends and capital gains. It is not possible to directly invest in any index.

\*60/40 NYSE Composite/Barclays U.S. AGG. Bond Index: This benchmark gives 60% weight to the NYSE Composite Index and 40% weight to the Barclays U.S. Agg. Bond Index. The NYSE Composite Index (NYA) measures the performance of all stocks listed on the New York Stock Exchange. It includes more than 1,900 stocks, of which over 1,500 are U.S. companies. Its breadth therefore makes it a much better indicator of market performance than narrow indexes that have far fewer components. The weights of the index constituents are calculated on the basis of their free-float market capitalization. The index itself is calculated on the basis of price return and total return, which includes dividends. The Barclays U.S. Aggregate Bond Index measures the underlying index and performance of the total U.S. investment grade bond market. It is a market value-weighted index that tracks the daily price, coupon, pay-downs, and total return performance of fixed-rate, publicly placed, dollar-denominated, and non-convertible investment grade debt issues with at least \$250 million per amount outstanding and with at least one year to final maturity.
